This will help you to investigate a variety of machine learning models that can be built by modifying data sets. The training data is pulled from the web. Learn more in these Kaggle Notebooks. You will be able to run the training and test samples with this solution. For you to proceed. How it works: To use this feature, you will first have to learn about the data contained in the Microsoft Data Mining Enterprise Edition (DMDEE) database. When you download the data using this solution, you will be provided with a query in a.mde format. The query provides access to an Excel data file. You will need to convert this data into a usable data set by using the conversion function. The data set contains all the tables, columns, and joins needed to make the training data. You will then be able to load the data into the SQL query window. You will be able to use a variety of tools to make modifications to the data. For example, you can remove rows and columns. You can also join different data sets together. You can change the data types. This will help you to identify relationships between the data sets. You will be able to use the query tool to choose training and test sets. This will be helpful in making comparisons between the machine learning models. You can also apply any number of different transformations to the data. The solution includes the Kaggle notebook. This will allow you to run the data sets. You will have access to the learning resource. You will be able to run the training and test sets. Finally, you will be able to compare the predictions made by different models. You will also be able to publish the models that you build. Save 82157476af
